RIFF JTAG Error codes and troubleshooting
Error code 0x82

1.2. Error code 0x82

Returned by routines which expect a different input parameter. Most often is returned by the h/w scripts (*.has) processing block in case when resurrector tries to execute a not supported h/w script instruction. This can happen because box's firmware is older than expected by used resurrector.

Solution:

Upgrade RIFF Box firmware to latest version.
